### update()

```
Route::post('post/update/{id}', [
  'middleware' => 'auth',
  'before' => 'csrf',
  'uses' => 'PostController@update'
]);
```

#### update()

```
public function update(Request $request, $id) {
   data = \Gamma
           'title' => $request->title,
           'body' => $request->body,
    ];
   $post = Post::findOrFail($id);
   $post->update($data);
   return $post->toJson();
```

#### create()

```
Route::post('post/store', [
   'middleware' => 'auth',
   'before' => 'csrf',
   'uses' => 'PostController@store'
]);
```

create()

En el método store de PostController añadimos esta línea para crear un nuevo registro:

Post::create(\$request->except('csrf'));
